

Here are the data we used in the London plague paper, which are all in R format. Data files end in .Rmd and the R code we used to create figures and tables is in london\_paper.R. If you want to run the code you will need to change the working directory to whatever your directory is by editing the setwd() line.

Annual births by parish are in births\_annual.Rda with missing values filled in using a SVD in births\_imputed.R. Deaths follow the same pattern, except that we have also added a file of weekly totals deaths\_weekly.Rda.
